Products supplied by SGM LEKTRA are guaranteed for a period of 12 (twelve) months from delivery date according to the conditions specified in our sale conditions document.

SGM LEKTRA can choose to repair or replace the Product.

If the Product is repaired it will maintain the original warranty terms, whereas if the Product is replaced it will have 12 (twelve) months of warranty.

The warranty will be null if the Client modifies, repair or uses the Products for other purposes than the normal conditions foreseen by instructions or Contract.

In no circumstances shall SGM LEKTRA be liable for direct, indirect or consequential or other loss or damage whether caused by negligence on the part of the company or its employees or otherwise howsoever arising out of defective goods

4-FEATURES

Flow rate range
RPmag is able to process signals from fluids with flow rates of up to 787.5 m³/h in both directions (bidirectional meter).

Range dimension / lining material
PTFE DN10 ÷ DN250 / RUBBER DN65 ÷ DN250

Sensor material
SS321

Housing material
epoxy painting aluminium

Electrodes material
SS316L - Hastelloy C - Titanium - Tantalum - Platinum

Accuracy
CLASS II

Repeatability
±0.1%

Fluid conductivity
>5 µS/cm.

Power supply
85÷265 Vac, 24 Vac/dc, 12 Vdc

Consumption
6 W, max. 8 W.

TEMPERATURE CLASS
T50

Ambient Temperature Limits
Remote version operating temperature: RUBBER -10 ÷ +80 °C; PTFE -40 ÷ +150 °C
Compact version operating temperature: RUBBER -10 ÷ +80 °C; PTFE -40 ÷ +100 °C
Storage temperature: -40÷+85 °C

Communication protocol
Modbus RTU

Data Logger
Internal data logger to USB pen drive for event counter variations

Output
4÷20 mA: 0÷500 Ω
Frequency output: 0.1÷10000 Hz
Pulse output: 24 Vdc galvanically isolated or open collector or open collector galvanically isolated 24 V 20 mA (opt)
Alarm output: 2 relays, 3 A 230 Vac N.O.

Reverse Flow
Allow measure reverse flow.

Output Testing
Relays output: Transmitter can switch relays at testing value.
Current Source: Transmitter can be commanded to supply a specified test current between 4.0 and 20.0 mA.
Frequency Source: Transmitter can be commanded to supply a specified test frequency between 0 and 10000 Hz.

Humidity Limits
0-100% RH to 150 °F (65 °C), not condensing.

Damping
Adjustable between 1 and 99 seconds.

Compact version IP rating
IP67

Remote version IP rating
sensor IP67 / IP68 (by request) - converter IP67

Anti-condensation filter
Anti-condensation filter installed on converter
Flow range from DN3 to DN250 (starting from DN10)

7-INSTALLATION

7.1 SAFETY MEASURE
Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Information that raises potential safety issues are indicated by a warning symbol. Please refer to the following safety messages before performing an operation preceded by this symbol.

7.2 WARNINGS

7.2.1 Explosions could result in death or serious injury
- Verify that the operating atmosphere of the sensor pipe and transmitter is consistent with the appropriate hazardous locations certifications.
- Do not remove the transmitter cover in explosive atmospheres when the circuit is alive.

7.2.2 Failure to follow safe installation and servicing guidelines could result in death or serious injury
- Make sure only qualified personnel perform the installation.
- Do not perform any service other than those contained in this manual unless qualified.

7.2.3 High voltage that may be present on leads could cause electrical shock
- Avoid contact with leads and terminals.

7.3 PRE-INSTALLATION
There are several pre-installation steps that make the installation process easier. They include identifying the options and configurations that apply to your application, setting the hardware switches if necessary, and consideration of mechanical, electrical, and environmental requirements. Please remember that the sensor pipe liner is vulnerable to handling damage. Never place anything through the sensor pipe for the purpose of lifting or gaining leverage. Damaged liner can render the sensor pipe useless.

7.3.1 Identify Options and Configurations
Standard application of the RPmag includes control of the sensor pipe coils and one or more of the following configurations or options:
- 4÷20mA output
- Pulse output
- Alarm output
- Data logger
Be sure to identify the options and configurations that apply to your situation, and keep a list of them nearby during the installation and configuration procedures.

7.3.2 Mechanical Considerations
The mounting site for the RPmag Transmitter should provide enough room for secure mounting, easy access to the conduit ports, full opening of the transmitter covers, and easy readability of the local operator interface (LOI) screen. The LOI can be rotated in 90° increments.

7.3.3 Lift
The flowmeter can be lifted using the lift as shown in following pictures. The safe load and measure for the lift should reach to the relative requirement. Don’t lift the flowmeter using the rope to tie the connection between the sensor and the transmitter (compact version) or the connecting box (remote version).
7.4 INSTALLATION GENERAL CRITERIA
The flowmeter can test automatically flow direction. Because the direction arrow marked on the nameplate is flow direction when calibrated in factory, you should install the flowmeter to make the actual flow direction same as the flow direction arrow marked on the nameplate. If this is not possible, simply reverse the direct flow direction through the "Indication" (see par. 10.4.3.4.1)
The upstream straight pipe should be longer than 5XD and the downstream straight pipe should be more than 3XD in order to guarantee the accuracy of measurement.

7.5 INSTALLATION IN PIPELINE
Installation may be horizontal or vertical, but make sure no deposit on the electrodes when horizontal installation. See Fig.13-A.

To install a rectifier or straight pipe is necessary to normalize the flow profile if there are pipe elbows, flow regulation valves or half-open ball valves in front of the sensor. See fig.13-B.
The electromagnetic flowmeter must be installed so that the pipe is always completely filled with fluid. In case of partially filled pipe, the flowmeter must be installed as shown in Fig. 14-A in order to create a siphon effect and keep the straight pipe always full. See Fig. 14-A.

Fig. 14-A Installation in partially filled pipes

The electromagnetic flowmeter must not be installed in the pipe section with a free pipe outlet that could run empty. When installing in a downstream pipe, please make sure the pipe is always fully filled with medium. See Fig. 14-B.

Fig. 14-B Installation in pipe without emptying
The electromagnetic flowmeter cannot be installed at the pipe highest point, because air or gas accumulations may occur in the measuring pipe. See Fig.15-A

![Fig.15-A Installation at highest point](image)

The electromagnetic flowmeter cannot be installed upstream of a pump to prevent cavitation, which can damage the sensor lining. See Fig.15-B

![Fig.15-B Pump proximity installation](image)

Install a siphon (a) with a vent valve (b) downstream of the sensor in down pipes longer than 5 meters. This precaution is to avoid low pressure and the consequent risk of damage to the lining of the measuring tube. See Fig.15-C

**WARNING:** all the phenomena that generate a strong depression inside the pipe can irredeemably damage the insulating coating of the sensor tube itself.
7.6 INSTALLATION PRECAUTIONS
An all-weather cover should be used to protect the housing from the direct sunlight or rain when the device is installed outdoor. Excessive vibrations, large ambient temperature variations and long-lasting showers must be avoided. It should also be protected from leakage of corrosive liquids.

7.7 PIPE CONNECTION
The sensor should be supported by the connecting pipes, it cannot withstand its own weight. Mechanical and thermal stress must be avoided.
7.8 MOUNTING REQUIREMENTS

a) The sensor pipe and the line pipes must have the same axis. For the sensors under DN50, the axial difference between the measuring tube and operating pipe should be less than 1.5mm; for the sensors from DN65 to DN250, it should be less than 2mm.

b) The gasket between flanges should have a good corrosion resistance. The gasket must not extend to the pipe inside.

c) The threads of the fasten bolts and nuts should be in good condition. The bolts should be fastened using torque spanner with certain torque according the size of flange.

d) It should take separate measure to prevent the lining from heat when weld or flame cutting in the pipe closed to sensor. If the sensor is installed in a well or immersed in water, the connecting box for sensor must be filled and sealed with sealing glue after commissioning.

7.9 ACCESSORIES

7.9.1 Optional grounding ring

Material: SS 316L or Hastelloy C
Thickness: 3mm for SS 316L or 1mm for Hastelloy C

For the non-conductive pipe, the grounding rings should be installed between the flanges of sensor and the pipes in order to keep sensor and measured liquid at the same potential.

![Grounding ring diagram]
7.10 EQUIPOTENTIALITY AND ELECTRICAL INTERFERENCE REDUCTION

The measuring circuit assumes the fluid at ground potential, as it is in most of application with conductive pipes. The sensor is isolated from the fluid because of the lining, therefore it's necessary to connect the grounding cables to the pipe's flanges, as shown in fig. 18-A. The resistance for grounding connection should be less than 10ohm.

Most of application do not require special precautions for installation, the only requirement is to keep the signal cable separate from the main cable. In case of sensor with cathodic protection or electrolysis processes, the main current shall not flow through the measured fluid.

The following measure should be taken in order to reduce the influence of magnetic field:

a) With conductive pipes, potential equalization is made by connecting sensor and the adjoining pipes as shown in figure. The bolt connection for flanges can not be used instead of the electric connection, it must have an additional electric connection as shown in **Fig.18A**.

![Fig.18A Sensor equipotentiality](image)

b) with non-conductive pipes, grounding rings must be installed between both sensor flanges and pipes, as shown in **Fig.18-B**.

![Fig.18B Grounding with non-conductive pipes](image)
c) Some systems, such as pipes with cathodic protection, may be affected by potential disturbance because not all the line is at ground potential. In order to eliminate this type of interference, the line must be isolated with two rubber pipes as shown in Fig.19A.

7.11 PREPARATION FOR OPERATION

Strictly check the installation and wirings before it gets into operation!

It shall be pointed out that the instrument, including the sensor and converter has been fully adjusted, calibrated with actual flow, and inspected under strict measures. All the units are certified. No further adjustments are required when put it into operation. Observe carefully the contents in this manual, to check and analyze any malfunction

The following steps have to be followed to get the instrument into operation.

1) Make sure that the sensor is completely filled with fluid.
2) Turn the power supply ON. After approx. one minute, the display will show a value which indicates that the wire connection is correct. If the flow value is negative, it can be adjusted (see par. 10.4.3.4.1).
3) Zero verification. Shut off the valve tight in downstream first and then the valve in upstream, to let the liquid stops to flow in the pipeline. The displayed value should be 0. The value displayed can be corrected at the converter if the value is different than 0: ref. par. 10.4.10.1.

7.12 MAINTENANCE

Generally, no extraordinary maintenance is needed on magnetic flowmeter. Only in case the product can adhere to the inner wall of the sensor, and its electrodes, it is necessary to perform periodic cleaning operations.

Be careful not to damage the lining and the electrodes.
8-ELECTRICAL CONNECTIONS

8.1 CABLE ENTRY
The compact version converter enclosure has n. 2 M20x1.5 cable glands.
The converter enclosure remote version has n.2 M20x1.5 cable glands for power supply and outputs signal, and 2 M16x1.5 cable glands for sensor pipe connection.

8.2 ELECTRICAL CONNECTION REQUIREMENTS
Before making the electrical connections, consider the following standards and be sure to have the correct power supply, ducts and other accessories.

8.2.1 Power supply voltage
RPmag transmitter is designed to be powered with 85 ÷ 265Vac (50 to 60 Hz), 24Vdc/ac, 12Vdc voltage.

8.2.2 Power supply voltage interruption
Power supply wires must be connected to the device via a circuit breaker or an external disconnecting switch. The switch or circuit breaker should be clearly labeled and located close to the transmitter.

8.2.3 Infiltration and humidity prevention
To avoid the humidity infiltration inside the converter and sensor pipe is recommended:
- Caps and cable glands must be well tightened.
- position the cable so that it forms a downward curve at the M20x1.5 and/or M16x1.5 output (see below figure); in this way the condensation and/or rain water will tend to drip from the curve bottom.

8.3 POWER CONNECTION
To connect the power supply to the meter, complete the following steps:
1) Open the box connections cover.
2) Insert the power supply cable through the cable gland.
3) Follow the sequent list to connect the power supply cable:
   AC Units:
   - Connect the GND grounding terminal
   - Connect the wire to terminal N.
   - Connect the phase to terminal L.
   DC Units:
   - Connect the GND grounding terminal
   - Connect + 24Vdc or 12Vdc to terminal L ( + ).
   - Connect 0V to terminal N ( - ).
8.4 Dip-Switch configuration

For the RPmag flowmeter proper operation, the dip-switch relative to the interface connection to the external diagnostic unit must be set to “ON” as shown in the following drawing.

8.5 OUTPUT

To connect the analog and/or impulsive output follow the instructions of the following points.

8.5.1 Analog output

The current output is powered from the transmitter. The circuit resistance must be equal to or less than 500ohm.
Follow the below steps to connect the signal cable to the transmitter:
1) Insert the signal cable through the cable gland.
2) Connect the two wires to I+ and I- terminals.

The below drawing shows the connection diagram between the RPMAG flowmeter and SLM2XH3 flow totalizer unit.
8.5.2 Digital output

When digital output is set in frequency mode, it generates an 0.1÷10000Hz output signal proportional to the measured flow rate; however, if it’s set in pulsed mode it generates a single pulse every certain step of totalizer increase. The signal is normally used in combination with an external totalizer, a pulse counter or an acquisition system. The resistance in the circuit must be equal to or greater than 100Kohms.

Follow the below steps to connect the signal cable to the transmitter:
1) Insert signal cable through the cable gland.
2) Connect two wires to F+/P+ and F-/P- terminals

N.B. - When the RPmag pulse output is connected to an acquisition system that requires a current higher than 11mA, a properly sized pull-up resistor must be connected to ensure the minimum current required by the acquisition system connected (see drawing below); example: if the acquisition system requires a min. current of 15mA, a 1.6 Kohm pull-up resistor must be connected (according to the calculation R = V / I = 24V / 15mA = 1.6Kohm) between an external power supply of 24 Vdc and the acquisition system input terminal

The below drawing shows the connection diagram between the RPMAG flowmeter and the 199-B1X counter unit.
8.5.3 Alarm output
Follow the below steps to connect the signal cable to the transmitter:
1) Insert the signal cable through cable gland.
2) Connect two wires to RL1, for the #1 alarm threshold, and RL2 terminals for #2 alarm threshold.

The below drawing shows the connection diagram between the RPMAG flowmeter and the 199-B2X multifunction counter unit.

8.5.4 RS485 serial output
Communicate via MODBUS RTU is possible in models with RS485 serial port.
Connect the serial cable to A+ and B- terminals.

The below drawing shows connection example diagram between RPMAG flowmeter and a PC.
8.7 REMOTE VERSION

During the remote version installation comply with the following information to ensure correct measurements:

1) The cables must be as short as possible, especially with low conductivity fluids.
2) The cables should be far from electrical machinery and switching devices such as contactors or solenoid valves.
3) The cables must not be in conduit with power cables or cables for the switching devices control.
4) When necessary, ensure the equipotential between sensor and transmitter.
5) The maximum cable length is a fluid conductivity function. Refer to paragraph 8.7.2.

Connect the sensor to the converter according to the below diagram.
### 8.7.1 Remote version wiring

In the graph below the gray highlighted area indicates the allowed cable length in relation to the fluid conductivity value. With an 150 microS fluid conductivity, for example, the connection cables will have a maximum length of 150 meters.

### 8.7.2 Connecting cables length

Maximum length of the connecting cables between the sensor and the convertor is determined by the fluid conductivity value.

In the graph below the gray highlighted area indicates the allowed cable length in relation to the fluid conductivity value. With an 150 microS fluid conductivity, for example, the connection cables will have a maximum length of 150 meters.

9-LOCAL OPERATOR INTERFACE (LOI)

LOI is an operator communications center for the RPmag. Through the LOI, the operator can access any transmitter function for changing configuration parameter settings, checking totalized values, or other functions.

9.1 SAFETY MESSAGES
Instructions and procedures in this section may require special precautions to ensure the safety of the personnel performing the operations. Information that raises potential safety issues are indicated by a warning symbol.

Please refer to the following safety messages before performing an operation preceded by this symbol: ⚠

9.2 WARNINGS
Explosions could result in death or serious injury
- Verify that the area of installation and operation comply with the characteristics of the measuring tube and the transmitter.
- Make sure only qualified personnel perform the installation.
- Do not perform any service other than those contained in this manual.

High voltage that may be present on leads could cause electrical shock
- Avoid contact with leads and terminals.

9.3 LOI Features
The LOI is implemented through VL701, a detachable display with 4 buttons which allows to perform all operational, control and programming instrument functions.

In the configuration menus, it’s possible:

1. Submenus and parameters access; press ⬇️ to select and press ⏎️ to access.

2. Parameter options choice: press ⬇️ to select the option and press ⏎️ to store the option. Press ⬆️ to exit without saving.

3. Configure the parameter values; in some parameters the configuration is done by setting a value (eg, in the MAX FLOW parameter is possible to change the number):
   - press ⬇️ to select the digit to be modified (the digit is highlighted in inverse), press ⏎️ to change the highlighted digits number, press ⏎️ save the set value and exit automatically. Press ⬆️ to exit without saving.

- Exit configuration
- Back to previous menu
- Parameters values modification
- Scroll cursor (to the right)
- Scroll parameters
- Configuration access
- Options confirmation
- Parameters values confirmation
9.4 VL701 DISPLAY MODULE

The VL701 programming module can be mounted and removed from the RPmag without affecting the unit operation. Unscrewing the cover, the VL701 module can be mounted (by clockwise rotation until it clicks) or dismounted (by rotation counterclockwise) as shown in figure.

9.5 DISPLAY ROTATION

If it is necessary the display can be rotated, as indicated in the following procedure:

1. Disconnect power supply from transmitter.
2. Unscrew the transparent cover.
3. Remove the two screws that secure the “display/electronics” bracket to the container, paying attention to the wiring between the electronics and the terminal.
4. Rotate the display / electronics bracket to set the position (minimum 90° rotation).
5. Tighten the two screws that secure the “display/electronics” bracket to the container.
6. Tighten the transparent cover.
9.6 INTERNAL DATA LOGGER USB PORT
The USB port is used to connect the pen drive, necessary for the internal event counter variation data logger. Customer must not remove the pen drive for any reason.
9.7 CONVERTER ROTATION

To a greater functionality and adaptation to the application the entire converter, in addition to the display, can be rotated by following the below steps:

⚠ Disconnect the power supply voltage.
1. Remove the four screws that secure the converter to the sensor pipe.
2. Slightly lift the converter paying attention to the electrical connections between the sensor pipe and the terminal.
3. Turn the converter (minimum 90° rotation) bringing it to the desired position.
4. Fix the converter to the sensor with the 4 fixing screws.
10-PROGRAMMING

10.1 DATA ENTRY
The LOI keypad has no numerical keys. Enter numerical data using the following procedure:
1. Access the appropriate function.
2. Use SCROLL to highlight the digit you want to enter or change.
3. For numerical data, UP ARROW scrolls the digits from 0 to 9 (UP ARROW or SCROLL are also used to toggle pre-determined choices that do not require data entry).
4. Use SCROLL to highlight and change other digits you want to change.
5. Push ENTER to confirm data entry.

10.2 KEYBOARD LOCK
Simultaneously pressing the LEFT ARROW and SCROLL keys from RUN mode, for 5 seconds, keyboard will be locked. Display will show PADLOCK symbol.

Simultaneously pressing the LEFT ARROW and SCROLL keys from RUN mode, for 5 seconds, keyboard will be unlocked.

10.3 DISPLAY PAGES
The RPmag, in RUN mode, has three pages to display data and status, press UP ARROW to manually change page. The pages will automatically alternate every 21S.

10.3.1 MAIN PAGE

Net total

Forward total

NET TOTALIZER
123,046m³

POSITIVE TOTALIZER
248,735m³

SYSTEM ALARM
PASSWORD KEY
(MENU ACCESS)
PEN DRIVE CONNECTED TO THE USB PORT
KEYBOARD LOCK
10.3.2 SECOND PAGE

Reverse total

Instantaneous flow measurement

Flow % value indicator

10.3.3 THIRD PAGE

- Flowmeter serial number
- Event number of the flow measurement parameters changing
- Sensor pipe DN
- Firmware version
- Configuration index
- Range ability
- Sensor Factor value

10.3.4 ALARMS PAGE

The symbol “!” will be displayed when there are system alarms.
Press SCROLL to access the alarms page.

Press SCROLL again to return to the main page (MAIN)
Press ENTER to clear the error history (CLEAN)

EMPY PIPE

MAIN CLEAN
10.4 LOI MENÚ
Press ENTER key from run mode and enter the password “1000” (the key symbol will appear on the display). Press ENTER to access the programming menu: display will show the list of configuration menu as shown here next.
Press UP ARROW or SCROLL keys to select the desired menu, then press ENTER key to access.

10.4.1 BASE SETUP menu

10.4.1 BASIC CONFIGURATION (BASIC SETUP)
Press ENTER key from run mode, the display will be as shown here next, then press ENTER to enter in “BASIC SETUP” menu.

Press UP ARROW or SCROLL keys to select the desired function and press ENTER key to access.

10.4.1.1 –DAMPING
It sets the integration time for measurement. Lower values mean fast response, higher values are suggested for reduction of fluctuations in flow measurement.
Default: 25s;
Range: 1÷100s

Press ENTER key, the display will be as shown here next. With UP ARROW or SCROLL select the option.
Press ENTER to confirm. The ☑ to confirm the parameter edit storage.
10.4.3 SYSTEM CONFIGURATION (SYSTEM SETUP)

Press ENTER key from run mode: the display will be as shown here next, then press SCROLL key to select “SYSTEM SETUP” menu and press ENTER to enter.

Press UP ARROW or SCROLL keys to select the desired function and press ENTER key to access.

10.4.3.1 LANGUAGE

Allows menu language selection.
Default: ENGLISH; Range: ENGLISH - ITALIANO – CHINESE

Press ENTER key, the display will be as shown here next.

With UP ARROW or SCROLL select the option.
Press ENTER to confirm.

The ☑ to confirm the parameter edit storage.

10.4.3.2 - DATA LOGGER

The USB pen drive data logger function is set in this menu.
Press ENTER to confirm.

The display will be as shown here next.
Press UP ARROW or SCROLL keys to select the desired function and press ENTER key to access.

10.4.3.2.1 CONNECT USB

Connect the pen drive to the USB port.

Press ENTER, after the “WAIT” message, the “USB CONNECTED” message will appear. If the “USB NOT FOUND” message is displayed, verify that the pen drive is properly inserted into the USB port.
10.4.3.2.2 - DISCONNECT USB

Disconnect the pen drive to the USB port.

Press ENTER, after the “WAIT” message, the “REMOVE USB” message will appear.

10.4.3.3 - DATE TIME

In the system clock and the calendar are set in this menu.

The display will be as shown here next. Press UP ARROW or SCROLL keys to select the desired function and press ENTER per accedervi.

10.4.3.3.1 YEAR

Sets the year in the YYYY format.

Press ENTER key, the display will be as shown here next. With UP ARROW change the digit, with SCROLL moves the cursor. Press ENTER to confirm. The ☉ to confirm the parameter edit storage.
10.4.3.3.2 MONTH
Sets the month in the MM format.

Press ENTER key, the display will be as shown here next.
With UP ARROW change the digit, with SCROLL moves the cursor.
Press ENTER to confirm.
The ☑ to confirm the parameter edit storage.

10.4.3.3.3 DAY
Sets the day in the dd format.

Press ENTER key, the display will be as shown here next.
With UP ARROW change the digit, with SCROLL moves the cursor.
Press ENTER to confirm.
The ☑ to confirm the parameter edit storage.

10.4.3.3.4 HOURS
Sets the hours in the HH format.

Press ENTER key, the display will be as shown here next.
With UP ARROW change the digit, with SCROLL moves the cursor.
Press ENTER to confirm.
The ☑ to confirm the parameter edit storage.

10.4.3.3.5 MINUTES
Sets the minutes in the mm format.

Press ENTER key, the display will be as shown here next.
With UP ARROW change the digit, with SCROLL moves the cursor.
Press ENTER to confirm.
The ☑ to confirm the parameter edit storage.
10.4.3.4 FLOW SETUP

The configuration parameters of the flow measurement are set in this menu.

Press ENTER to access.
The display will be as shown here next.
Press UP ARROW or SCROLL keys to select the desired function and press ENTER key to access.

10.4.3.4.1 FLOW DIRECTION

Sets the positive flow direction with respect of the arrow on sensor pipe.
Default: NORMAL FLOW DIR
Range: NORMAL FLOW DIR; INVERT FLOW DIR

Press ENTER key, the display will be as shown here next.
With UP ARROW or SCROLL select the option.
Press ENTER to confirm.
The ☑️ to confirm the parameter edit.
10.4.3.4.2 EN. FLOW MEASURE
This parameter enables the flow direction measurement and its related totalizer
Default: BIDIREC (bidirectional)
Range: FORWARD; REVERSE; BIDIREC (bidirectional).

Press ENTER key, the display will be as shown here next.
With UP ARROW or SCROLL select the option.
Press ENTER to confirm.
The ☑️ to confirm the parameter edit.

10.4.3.4.3 MAX FLOW
Set the flow measurement 100%. This value adjusts the analog output end scale (20mA) and the frequency output end scale. The range is related to the sensor DN.
The default value is the maximum flow rate for the MID approval according to the sensor pipe DN.

Press ENTER key, the display will be as shown here next.
With UP ARROW change the digit, with SCROLL moves the cursor.
Press ENTER to confirm.
The ☑️ to confirm the parameter edit storage.
10.4.4 DIGITAL OUTPUT
The F/P digital output parameters are set in this menu.

Press ENTER to access.
The display will be as shown here next.
Press UP ARROW or SCROLL keys to select the desired function and press ENTER key to access

10.4.4.1 FREQ. MAX
Sets the maximum frequency in relation to MAX FLOW.
The digital output is active as a frequency output only when the parameter “VOL/PULSE” is set to 0.
Default: 10000Hz;
Range: 00000÷10000 Hz.

Press ENTER key, the display will be as shown here next.
With UP ARROW change the digit, with SCROLL moves the cursor.
Press ENTER to confirm.
The ☺ to confirm the parameter edit storage.
10.4.4.1.2 VOLUME/PULSE
Sets the volume per pulse. When this parameter is set to 0, the digital output is active as a frequency output (see “FREQ. MAX”).
The measurement unit m³.
Default: 0000.00; Range: 0000.00÷9999.99
Press ENTER key, the display will be as shown here next.
With UP ARROW change the digit, with SCROLL moves the cursor.
Press ENTER to confirm.
The ☑ to confirm the parameter edit storage.

10.4.4.1.3 PULSE LENGTH
Sets the pulse width in ms.
Default: 0002ms; Range: 0001÷100ms
Press ENTER key, the display will be as shown here next.
With UP ARROW change the digit, with SCROLL moves the cursor.
Press ENTER to confirm.
The ☑ to confirm the parameter edit storage.

10.4.4.1.4 PULSE FRONT
Sets the pulse output energy level. When set ACTIVE LOW the pulse count is low, when set ACTIVE HIGH, the pulse count is high.
Default: ACTIVE LOW; Range: ACTIVE LOW; ACTIVE HIGH.
Press ENTER key, the display will be as shown here next.
With UP ARROW or SCROLL select the option.
Press ENTER to confirm.
The ☑ to confirm the parameter edit storage.
10.4.4.1.5 DGT OUT COPY RL1

This function sets the F/P collector output as a copy of RL1. The available options are:
- NO; the RL1 output is associated with the function set to the parameter “RL1 FUNC” (default setting)
- YES; the P+/- open collector output is associated with the function set to the parameter “RL1 FUNC”; eg. with “RL1 FUNC” set to “MAX”, the P +/- output state is low (0Vdc) during the non-alarm condition, and is high (24Vdc) during the alarm condition.

N.B. - Selecting the “YES” function the F/P output can not be used as an pulse counter or frequency output

Default: NO; Range: YES; NO

Press ENTER key, the display will be as shown here next.
With UP ARROW or SCROLL select the option.
Press ENTER to confirm.

The ☑ to confirm the parameter edit storage.

10.4.4.2 RS485 SETUP

The configuration parameters of the RS485 port are set in this menu. Press ENTER to access.

The display will be as shown here next.
Press UP ARROW or SCROLL keys to select the desired function and press ENTER key to access
10.4.4.2.1 NETWORK ID
Set the unity UID in RS485 network
Default: 001
Range: 001÷247.
Press ENTER key, the display will be as shown here next.
With UP ARROW change the digit, with SCROLL moves the cursor.
Press ENTER to confirm.
The ☺ to confirm the parameter edit storage.

10.4.4.2.2 BAUD RATE
Sets the RS485 output Baud Rate.
Default: 9600; Range: 9600; 19200; 38400; 56000; 57600; 115200.
Press ENTER key, the display will be as shown here next.
With UP ARROW or SCROLL select the option.
Press ENTER to confirm.
The ☺ to confirm the parameter edit.

10.4.4.2.3 PARITY
Sets the RS485 output Parity.
Default: NONE
Range: NONE; ODD; EVEN.
Press ENTER key, the display will be as shown here next.
With UP ARROW or SCROLL select the option.
Press ENTER to confirm.
The ☺ to confirm the parameter edit.

10.4.4.2.4 STOP BITS
Sets the RS485 output Stop Bit
Default: 1 BIT
Range: 1 BIT; 2 BITS.
Press ENTER key, the display will be as shown here next.
With UP ARROW or SCROLL select the option.
Press ENTER to confirm.
The ☺ to confirm the parameter.
10.4.5 TEST menu

10.4.6 OUTPUT SIGNAL TEST (TEST)

Press ENTER key from run mode: the display will be as shown here next, then press SCROLL key to select “SYSTEM SETUP” menu and press ENTER to enter.
Press UP ARROW or SCROLL keys to select the desired function and press ENTER key to access.

10.4.6.1 TEST 4-20mA

“TEST 4-20mA” force the 4÷20mA signal output to the value set for the test
Example: Setting the testing value at 16.2 mA, the actual output signal value is forced to 16.2mA. When exiting the TEST function, the 4-20mA output signal returns to be in compliance with the actual measurement FLOW set function.
Default: 12mA. Range: 4÷20mA

Press ENTER key, the display will be as shown here next.
With UP ARROW change the digit, with SCROLL moves the cursor.
Press ENTER to confirm the test value.
Press LEFT ARROW to exit.
10.4.6.2 TEST FREQ

“TEST FREQ” force the frequency signal output to the value set for the test. Example: Setting the testing value at 2000Hz, the actual output signal value is forced to 2000Hz. When exiting the TEST function, the frequency output signal returns to be in compliance with the actual measurement.
FLOW set function. Default: 5000 Hz. Range: 0÷10000 Hz

Press ENTER key, the display will be as shown here next.
With UP ARROW change the digit, with SCROLL moves the cursor.
Press ENTER to confirm the test value.
Press LEFT ARROW to exit.

10.4.6.3 TEST RELAYS

Test the RL1 and RL2 relay outputs is possible in this menu.
Press ENTER to access.

The display will be as shown here next.
Press UP ARROW or SCROLL keys to select the desired function and press ENTER key to access.

10.4.6.3.1 TOGGLE RL1/2

Forcing the status change of the output RL1/2 relay

Press ENTER key, the display will be as shown here next.
Press ENTER to switch from the OFF state to the ON state.
Press LEFT ARROW to exit.
10.4.6.4 TEST DGT INPUT
To verify the “D.I.” digital input function.

Not available on this instruments.

10.4.6.5 TEST PULSE OUTPUT
To verify the F/P pulse output functionality.

Each time the ENTER key is pressed, the F/P output generates a pulse with a length equal to what set in the “PULSE LENGTH ms” parameter, and simultaneously increments the test counter shown in the display center.
10.4.7 Menú. INFO

Press ENTER key from run mode: the display will be as shown here next, then press SCROLL key to select “INFO” menu and press ENTER to enter.

Press UP ARROW or SCROLL keys to select the desired function and press ENTER key to access.
10.4.8.1 PIPE DN

Press ENTER to access.

It is useful to check correspondence with the “Connection” data reported on the adhesive rating plate located on the sensor pipe. The display shows the set DN of the measuring pipe.

10.4.8.2 SENSOR K

Press ENTER to access.

It is useful to check correspondence with the “SENSOR K” data reported on the adhesive rating plate located on the sensor pipe. The display shows the set SENSOR K of the measuring pipe.

10.4.8.3 TOTAL h

Press ENTER to access.

The display shows the total hours of the flowmeter operation.

10.4.8.4 LAST RESET

Press ENTER to access.

The display shows the date and time of the last reset of the totalizer.
10.4.8.5 FW VERSION
Press ENTER to access.

The display shows the firmware version.

10.4.8.6 I.C.
Press ENTER to access.

The display shows the configuration index (I.C.) of the flowmeter.

10.4.8.7 WELCOME TEXT
Press ENTER to access.

The display will be as shown here next.
With UP ARROW/SCROLL change the digit, with ENTER moves the cursor.
To confirm press ENTER until the cursor reaches the end of second row
and automatically comes back to info menu.
10.4.9 CALIBRATION Menu.

10.4.10 SYSTEM CALIBRATION (CALIBRATION)

Press ENTER key from run mode: the display will be as shown here next, then press SCROLL key to select “CALIBRATION” menu and press ENTER key to access.

Press UP ARROW or SCROLL keys to select the desired function and press ENTER key to access.

10.4.10.1 ZERO FLOW

Zero flow measurement calibrate. The sensor must be full and the flow stopped.

Default: NO Range: YES - NO.

Press ENTER key, the display will be as shown here next.
With UP ARROW or SCROLL select the option.
Press ENTER to confirm.
10.4.10.2 4mA OUTPUT

Performs calibration of 4mA.

Press ENTER key, the display will be as shown here next. Connect a mA meter to the analog output; if the detected current measurement is different from 4 mA it is possible to correct the value of the output current with UP ARROW (UP) or SCROLL (DOWN). Press ENTER (OK) to confirm.

10.4.10.3 20mA OUTPUT

Performs calibration of 20mA.

Press ENTER key, the display will be as shown here next. Connect a mA meter to the analog output; if the detected current measurement is different from 20 mA it is possible to correct the value of the output current with UP ARROW (UP) or SCROLL (DOWN). Press ENTER (OK) to confirm.

10.4.10.4 PIPE SETUP

Performs the calibration of empty pipe sensitivity press.
ENTER to access.

The display will be as shown here next. press UP arrow or SCROLL keys to select the desired function and press ENTER key to access.

10.4.10.4.1 ENABLE E.P. FUNCT.

Enables or disables the empty pipe detection.
Default: YES
Range: YES - NO

Press ENTER key, the display will be as shown here next. With UP arrow or SCROLL select the option. Press ENTER to confirm.
10.4.10.4.2 FULL PIPE

ATTENTION: pipe must be full before continue.
Performs a full pipe recognition self calibration.
Default: NO Range: YES - NO.

Press ENTER key, the display will be as shown here next.
With UP ARROW or SCROLL select the option.
Press ENTER to confirm.
The successful calibration is confirmed by the OK symbol.

10.4.10.4.3 EMPTY PIPE

ATTENTION: pipe must be empty before continue.
Performs an empty pipe recognition self calibration.
Default: NO Range: YES - NO.

Press ENTER key, the display will be as shown here next.
With UP ARROW or SCROLL select the option.
Press ENTER to confirm.
The successful calibration is confirmed by the OK symbol.

10.4.10.4.4 EPH

Sets the system sensibility level to recognize the air presence in the sensor: the higher the value, the greater the sensitivity.
Default: 15%
Range: 010÷90%.

Press ENTER key, the display will be as shown here next.
With UP ARROW change the digit, with SCROLL moves the cursor.
Press ENTER to confirm.
The to confirm the parameter edit storage.
10.4.10.4.5 RESTORE DEFAULT

Restores the factory settings of all pipe setup parameters.
Default: NO
Range: NO - YES

Press ENTER key, the display will be as shown here next.
With UP ARROW or SCROLL select the option.
Press ENTER to confirm.
The successful of operation is confirm by the ☺ symbol.
**10.4.11 RELAYS SETUP MENU**

![Diagram of relays setup menu]

**10.4.12 RELAY CONFIGURATION (RELAYS SETUP)**

Press ENTER key from run mode: the display will be as shown here next, then press SCROLL key to select “RELAYS SETUP” menu and press ENTER to enter.

Press UP ARROW or SCROLL keys to select the desired function and press ENTER key to access.

**10.4.12.1 RL1/RL2 FUNC**

Submenu for output relay RL1/RL2 settings.

Press UP ARROW or SCROLL keys to select the desired function and press ENTER key to access.

**10.4.12.1.1 NONE**

Disable the RL1/RL2 output
Press ENTER to confirm.
10.4.12.1.2 MIN-MAX

Settings for the activation of the RL1/RL2 alarm

Press UP ARROW or SCROLL keys to select the desired function and press ENTER key to access.

10.4.12.1.2.1 INPUT SOURCE

Associates the alarm signal to a measured variable
Default: FLOW Range: FLOW; ANALOG 1; ANALOG 2; ANALOG 1- ANALOG 2

Press ENTER key, the display will be as shown here next.
With UP ARROW or SCROLL select the option.
Press ENTER to confirm.

The ☑ to confirm the parameter edit storage.

10.4.12.1.2.2 TH VALUE

Set the alarm threshold.
The associated measurement unit is in relation to the “INPUT SOURCE” setting.

Press ENTER key, the display will be as shown here next.
With UP ARROW change the digit, with SCROLL moves the cursor.
Press ENTER to confirm.

The ☑ to confirm the parameter edit storage.

10.4.12.1.2.3 MIN/MAX

Set the relay operation mode: minimum or maximum alarm with relay de-energized and open contact
Default: MIN Range: MIN – MAX

Press ENTER key, the display will be as shown here next.
With UP ARROW or SCROLL select the option.
Press ENTER to confirm.

The ☑ to confirm the parameter edit storage.
10.4.12.1.3 NEG. DIRECTION

Activate the RL1/RL2 output as a reverse instantaneous negative flow rate alarm.
Press ENTER to confirm.

10.4.12.1.4 DIAGNOSTIC ALARM

Activate the RL1/RL2 output for diagnostic alarm: coil connection interruption; connection; empty pipe
Press ENTER to confirm.
I certify that the equipment:

(Electromagnetic induction flow measurement)

conforms to the technical requirements stated on Technical Data Sheet and it is made in compliance with the assembly and checking procedures

Quality Control Manager: .......................................................... Production and check date: ..................................................
