5-INSTALLATION

5.1 MOUNTING PRECAUTIONS

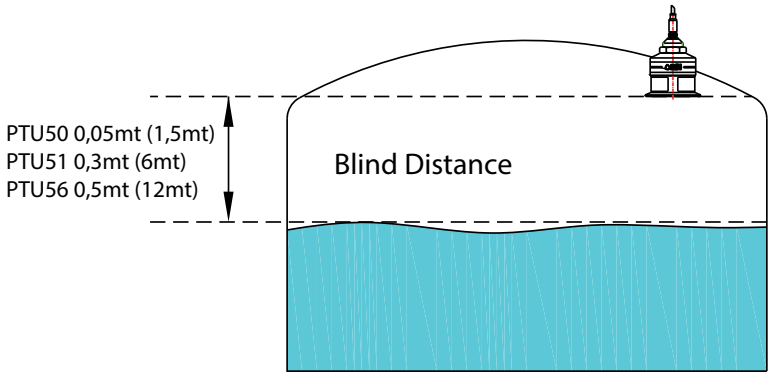
5.1.1 Mounting position

- With cambered roof, Do not install the sensor in the tank center (b). Leave a 300mm (d) minimum distance between the sensor and the tank smooth wall.
- Use a protective cover to protect the sensor from weather and direct sunlight (c).
- Do not install the sensor near the load zone (a).
- Make sure that in the sensor emission beam (lobe “α”) there are no obstacles (f,s) that can be intercepted as level.
- Make sure that there is not foam presence on the product surface to be measured.

	Lobo “α“
PTU50 1,5mt	5°
PTU51 6mt	5°
PTU56 12mt	5°

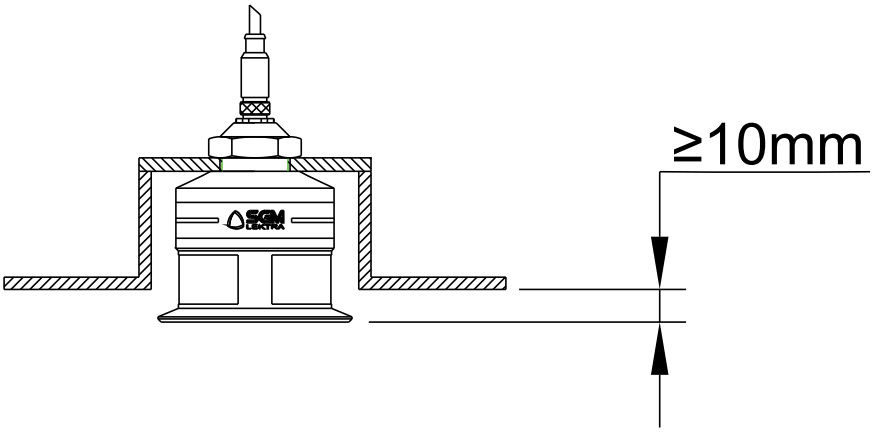
5.1.2 Blind distance

During installation is important to remember that in the sensor vicinity there is a blind zone (or BLIND DISTANCE) of 0.05m (for 1.5m max PTU50 range), 0.3m (for 6m max PTU51 range) or 0.5m (for 12m max PTU56 range) where the sensor can not measure.

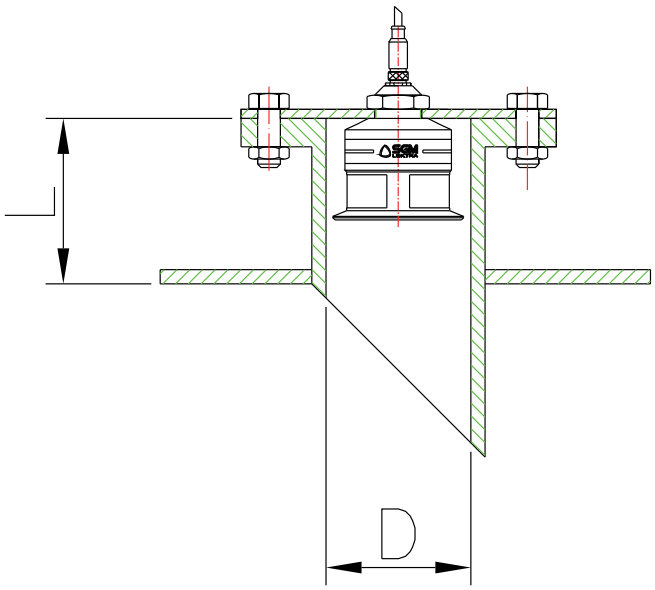


5.1.3 Installation in nozzle

Installing the PTU50-51-56 sensor in a nozzle, make sure the sensor bottom protrudes at least 10 mm from the bottom nozzle.



PTU50-51-56 can be installed in an extension pipe to turn away the sensor from the maximum level point.
The extension pipe must be flat and without joints (welds, etc..), also, the pipe terminal part must be cut at 45° and with the borders without burr.



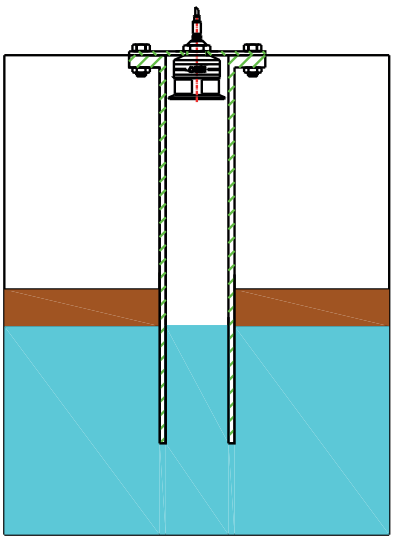
PTU50 1,5mt - PTU51 6mt		PTU56 12mt	
D (mm)	L max (mm)	D (mm)	L max (mm)
100	80	125	240
125	240	125	300
150	300		

5.1.4 Reference pipe installation

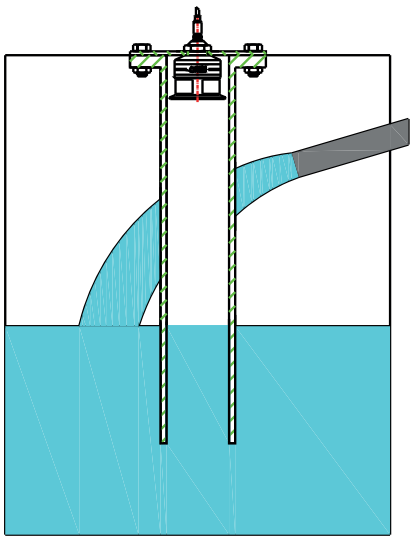
Disturbing factors that may influence the level measurement in liquids, as for example:
- foam presence on the product surface
- internal structures presence in the tank
- presence on the liquid surface of floating bodies can be avoided with the use of level measurement inside of pipes (by-pass pipe or calm pipe with 100mm min. diameter for PTU50-51, or 125mm min. diameter for PTU56)

The pipe must have a length greater or equal than the empty distance, also, must have some of vent holes to allow the pipe regular filling and emptying.
In the programming menu, to the “PRODUCT” parameter, must select the “LIQUID PIPE” option

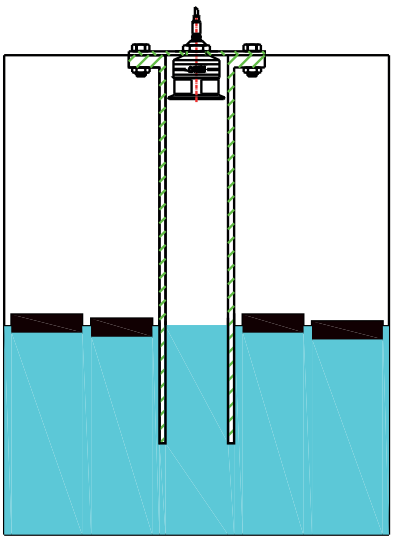
Foam

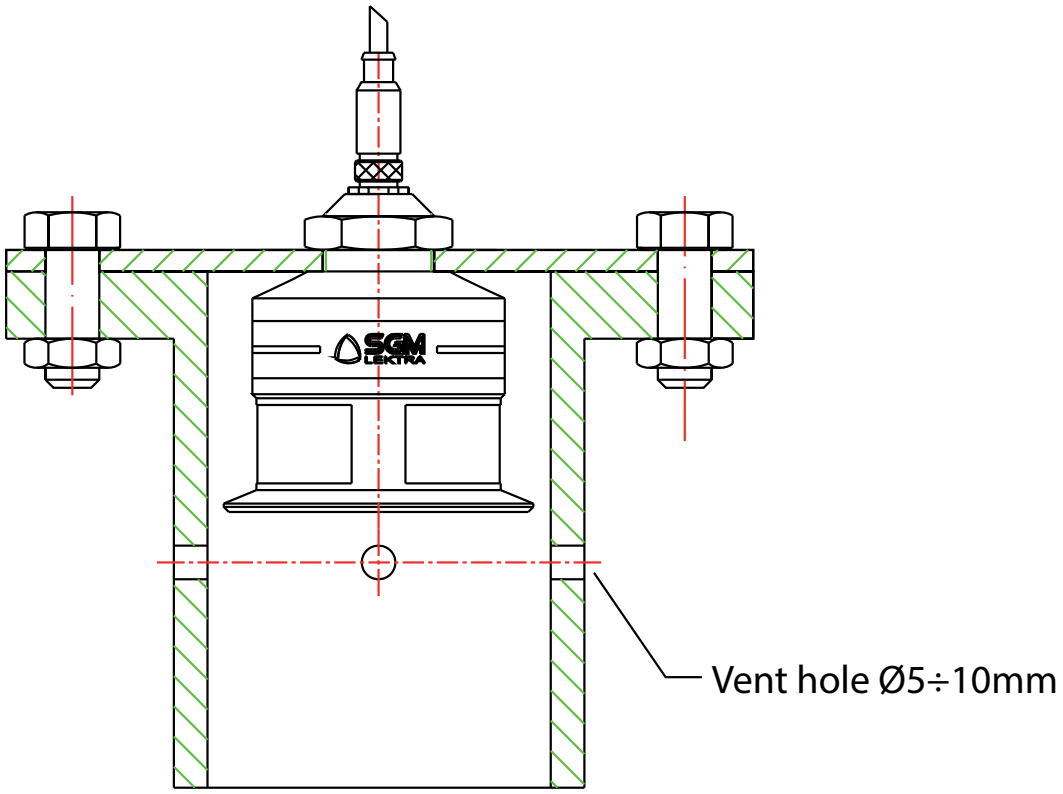


Internal structures



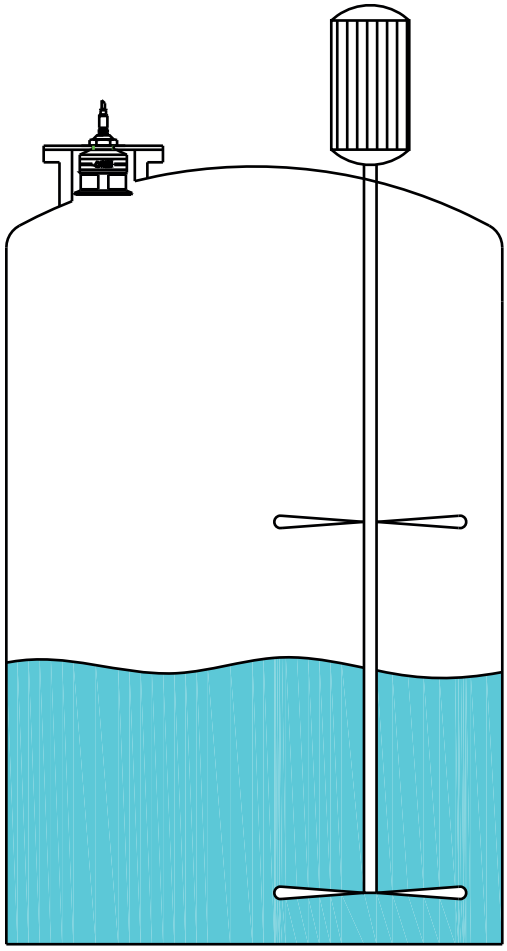
Floating bodies





5.1.5 Agitators presence

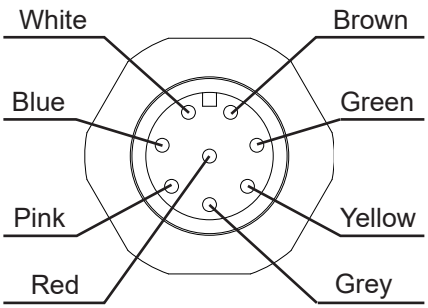
The level measurement is possible thanks to the Auto-Tuned statistical filter.
Should rarely need to adjust the filter setting by editing 2 PTU50-51-56 sensor programming parameters:
- FILTER; this parameter is present in the Quick Setup menu and in the Advanced Configuration “SETUP” menu; increasing the parameter value, decreases the sensor sensitivity to the level measurement sudden variations.
- F-WINDOW; this parameter is present in the Advanced Configuration “SERVICE” menu; decreasing the parameter programmed value, increases the sensor immunity to false echoes.



6-ELECTRICAL CONNECTIONS

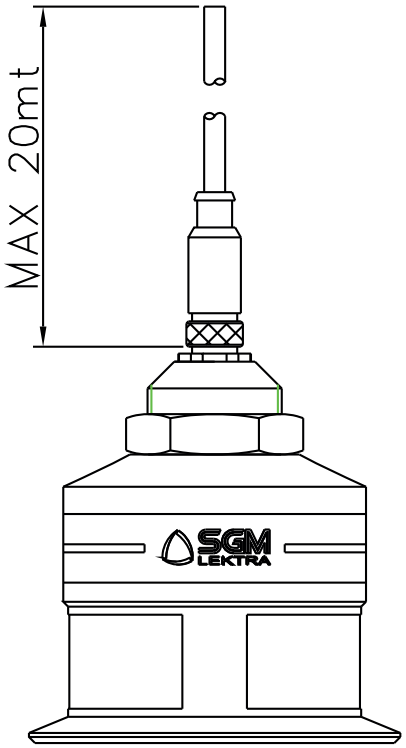
6.1 WIRING

1) Separate the engine control cables or power cables from the PTU5x connection cables
2) Isolate unused wires of the cable.
3) Fully tighten the connector ring nut.



Brown	GND (0V)
Red	+24 Vdc
White	SDA Display
Yellow	+4÷20mA

Green	A (RS485)
Blue	B (RS485)
Pink	+3.3V Display
Grey	SCL Display

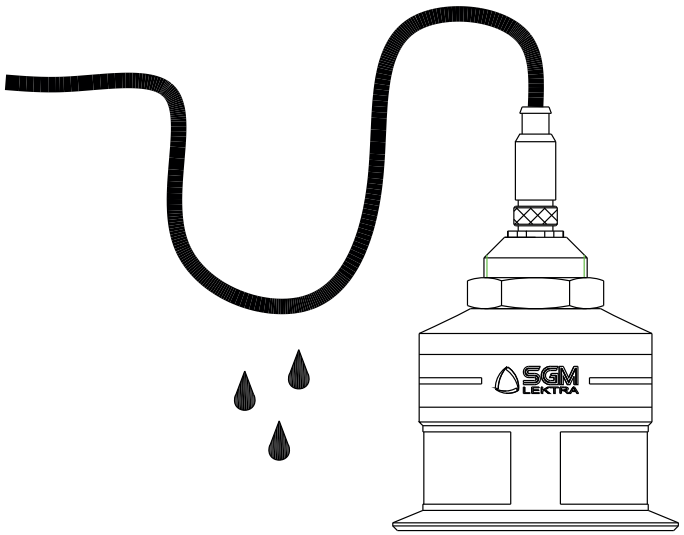


6.2 MOISTURE INFILTRATION

To avoid moisture infiltration inside the connector it is recommended to:

- Screw the connector nut ring tightly by hand.

- position the cable so that it forms a downward curve; in this way the condensation and/or rain water will tend to drip from the curve bottom



6.3 DIGITAL COMMUNICATIONS CONNECTION

6.3.1 Via MODBUS RTU

1) PTU50, PTU51 o PTU56 with MODBUS RTU communication protocol
2) USB/RS485 interface module, cod.694A004A
3) MODBUS RTU communication S/W, cod.010F105A
With this software is possible:
- connect, by selecting the UID address, the PTU50, PTU51 or PTU56 transmitters in MODBUS RTU network
- read on your PC monitor all measures in reading and operation data
- programming all configuration parameters
- storing on files, data logger function; measures in reading and operating states

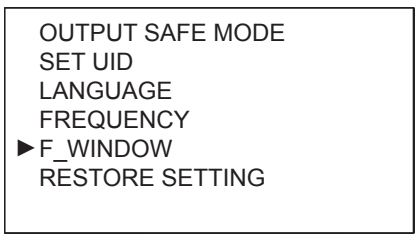
9.8.5 - F_ WINDOWS

Position the cursor on F_WINDOWS, press ENTER to access.



It is the increase value (in cm), step to step, of the window width during the echo signal research phase.
The "F_WINDOWS" is the area where the echo reception is active.
Normally it is positioned around the real echo signal and all echoes detected within the F_WINDOW are deemed valid.
Example: F_WINDOW parameter set to 5.

- The METER detects an echo signal which is 4 meters from the sensor.
- Suddenly, the echo signal disappears and a new echo signal to 3.5 mt away from the sensor is detected.
- Each time the echo signal will be emitted, the METER will enlarge "F_WINDOW" with 5cm step, until covering the new eco detected area. Now the F_WINDOW will start to tighten around the new echo signal and the new measurement of 3,5mt distance will be used to calculate the level measurement, alarm thresholds, etc..

F_WINDOW serves to filter false echo signals products, for example, by the agitator blades
Range: 05÷20
Use UP ARROW and SCROLL to modify the value.
Press ENTER to confirm.
